BASSMAN® DRIVER

0234610000

Bassman® pedals have all your basses covered. Drawing inspiration from the original tube amp line that laid way for Fender's sub-sonic signal processing, the Bassman pedal line hosts a collection of meticulously crafted analog and digital circuits all curated from the ground up for bass-centric tonal expansion.

Conjure varying shades of gain, from light tube-like breakup to hi-gain chunk, while keeping your low end intact. Utilizing a complement of JFET circuitry and dynamic clipping stages, the Bassman Driver emulates the behavior of a bass tube amp driven to breakup. Flick the voice switch into the up position to kick in an additional layer of clipping for a heavy modern distortion voicing. Sculpt your tone further using the mids switch, offering two dialed-in levels of growl, and an internal tone control to set the high frequency content to your liking. The blend control keeps your low end solid by blending body and dynamics from your clean tone back into the mix.

PRODUCT DETAILS

KEY FEATURES

Two gain voices designed around JFET circuitry and dynamic clipping stages for tube like distortion

Built in speaker emulation ensures great sound through any bass cab or PA

Soft-touch relay true bypass with auto bypass when no power is present

Side mounted pad switch to suit active basses

Top mounted jacks and road-ready aluminum enclosure

Inset aluminum face plate draws in vintage Fender aesthetics
